

Individuell reflektion (final)

2021-05-21

Hanna Schaff

For this final reflection I have changed the questions to be able to discuss and reflect on the project as a whole.

1 What have I learned from the project?

I've learnt a lot about code, code quality, what a bad vs a good solution is and how to prioritize/determine if it's worth the time to try and find the better solution. I've also learned a lot about agile and how to create value in a project. For some reason the idea of always delivering each sprint and working vertically rather than horizontally has not been an obvious thought to me before, and it has proved incredibly useful to know.

2 What did we do well?

I think we had good priorities throughout the project. Since we had a clear idea of what we were supposed to produce, and since we started out following tutorials and learning together, we could all work in parallel and focus on implementation rather than decision-making. This resulted in us being able to spend a lot more time learning, implementing and discussing code. For this project in particular, that has been a good ratio of admin stuff to programming.

3 What could we have done better?

Towards the end we got a little disorganized, there were differences especially in output messages, and some code was not properly tested. Before delivering the code to our client we will have a larger test session. That is something we should have done earlier and perhaps using external testers.

Also one person in our group had a lot more responsibility and subsequently spent more time on the project than the rest of us. I

believe they would have said something if they didn't want to have that role (they know our client and is active in the Discord server which will be using the bot), however maybe I think that should have been a conversation at some point.
